

Senior operator and product builder, working with sports organisations that need experienced AI and data leadership but aren't at the scale to justify a full-time hire. I help clubs, leagues and platforms make sensible technology bets, manage vendors from the buyer's side of the table, and turn raw video and event data into commercial, performance and fan engagement value.

What I do

I take on a small number of clients in fractional or project roles. Typical engagements involve setting AI and data roadmaps, evaluating vendors and helping with procurement, working through build-vs-buy decisions, and developing internal capability alongside whatever team the organisation already has. I sit on the client's side of the table, not the supplier's.

What comes with me

Alongside the advisory work, clients get preferential access to the platform stack I've been building under Miggle — available to deploy on the client's own cloud infrastructure, with the client owning the data:

- An event-timestamped synchronisation layer for video, audio and stats — the spine that everything else runs on (TrackIt).
- Sponsor analysis with Nielsen-style scoring on logo duration, size, clarity and screen position.
- Multi-language commentary translation with synthesised audio output.
- Automated highlights from OBS / vMix feeds, post-match or near-live.
- AI event detection that builds timestamps from un-tagged or archive footage.
- PPV / VOD infrastructure and an AI-agent layer over the resulting club archive.

Where I focus

Football is the deepest pocket of work, with active engagements across streaming, broadcast and club-side AI. I have particular interest in the women's game, where the structural data and tech gap below the WSL is sharper than in the men's pyramid — Tier 3 and Tier 4 players sit much closer to the top of the pyramid than their men's equivalents, which changes the case for cost-effective, standardised tooling. I also work across motorsport, rugby and other sports where similar workflow and commercial problems recur.

Background

Five years across three sports tech businesses before returning to Miggle full-time. Most recently led the Intelligence BU at PMY across EMEA — tier-one clients including Premier League clubs, LIV Golf, EuroLeague Basketball and the ECB — growing revenue from a Premier League client by 185%+ in year one through computer-vision work on their video archive. Before that, Director of Product Management at Tempus Ex Machina, rolling out cloud-based real-time video and stats analysis for NFL Football Operations. Earlier, eleven years running Miggle as a profitable digital agency, and senior product roles at Yahoo Europe including ownership of Yahoo Sports.

Engagement shapes

Fractional retainer. 1–2 days per week over a defined period. Best for clubs and platforms with an ongoing AI agenda and no senior person yet in seat.

Project-based. Scoped deliverables — AI roadmap, vendor evaluation, sponsor reporting, archive analysis, workflow audit. Best when there's a specific decision to make.

Strategic advisory. Smaller commitment, board-level input on technology bets, hiring and supplier choice. Best for organisations who already have execution capacity but want experienced challenge.
